

“Betweenness” and “Diversity” in Journal Citation Networks as Measures of Interdisciplinarity

— A Tribute to Eugene Garfield —
Scientometrics, memorial issue

Loet Leydesdorff, Caroline S. Wagner, & Lutz Bornmann

loet@leydesdorff.net ; wagner.911@osu.edu ; bornmann@gv.mpg.de

“Interdisciplinarity”?

1. Political and scholarly discourse

- Politicians ask for more “interdisciplinarity” and “transdisciplinarity”;
- Quality control problems when one moves beyond “multi-disciplinarity”
 - Van Noorden (2015): Interdisciplinary research has long-term impact (> 10 years)
 - Nichols (2014): 89% of the portfolio of the Directorate for SBE of the the NSF is IDR.

2. How to delineate disciplines → potential drift in the definitions

- Indicators are sensitive for changes in the delineations
- WoS Subject Categories (pragmatic) vs. algorithmic decompositions
- Changing boundaries

3. Different indicators:

- Diversity: composed of (i) variety, (ii) disparity and (iii) balance
- Betweenness Centrality: a family of indicators.

4. New developments

- in the journal landscape such as *PLoS ONE* (2006); multi-disciplinary?
- Paper level (“direct citation”) vs. journal level

Advances since: Leydesdorff, L., & Rafols, I. (2011). Indicators of the interdisciplinarity of journals: Diversity, centrality, and citations. *Journal of Informetrics*, 5(1), 87-100.

1. The problem of **delineation** can be “solved” in terms of the statistics using VOSviewer:
 - Leydesdorff, L., Bornmann, L., & Wagner, C. S. (2017). Generating Clustered Journal Maps: An Automated System for **Hierarchical Classification**. *Scientometrics*, 110(3), 1601-1614.
2. **Valued betweenness** centrality (Brandes, visone); 64-bit computing power;
3. “**True diversity**”:
 - Zhang, L., Rousseau, R., & Glänzel, W. (2016). **Diversity of references as an indicator for interdisciplinarity of journals**: Taking similarity between subject fields into account. *Journal of the Association for Information Science and Technology*, 67(5), 1257-1265.
4. Network measures (based on relations; e.g., geodesics) *versus* measures in the vector space (based on correlations) → different distances

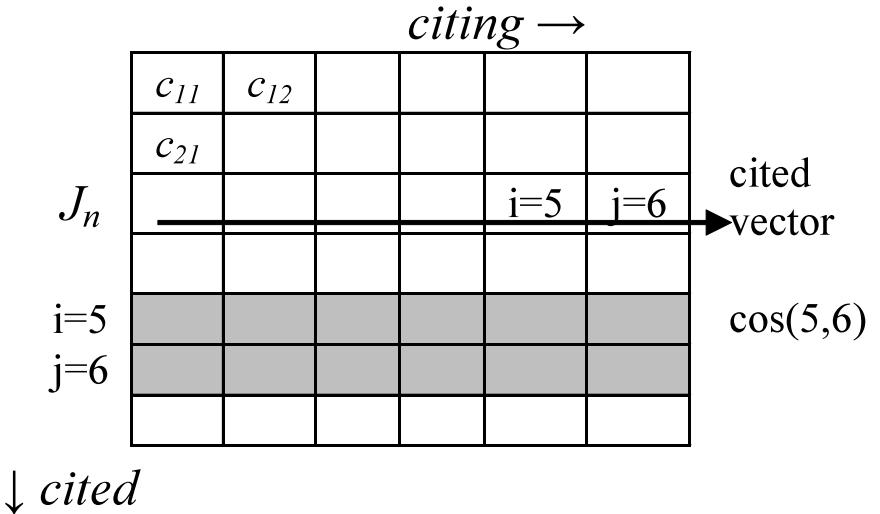

$$\text{Betweenness Centrality: } BC_k = \sum_i \sum_j \frac{g_{ijk}}{g_{ij}}, i \neq j \neq k$$

- Family of measures developed since Freeman's introduction in 1971:
 - Freeman, L. C., Borgatti, S. P., & White, D. R. (1991). Centrality in valued graphs: A measure of betweenness based on network flow. *Social Networks*, 13(2), 141-154.
 - Brandes, U. (2008). On variants of shortest-path betweenness centrality and their generic computation. *Social Networks*, 30(2), 136-145.
→ [implementation in visone](#)
 - Liu, J. S., & Lu, L. Y. (2012). An integrated approach for main path analysis: Development of the Hirsch index as an example. *Journal of the American Society for Information Science and Technology*, 63(3), 528-542.
- BC can be computed on an [asymmetrical \(1-mode\) matrix](#).
- Graph-analytical: based on [geodesics](#)

Rao-Stirling Diversity:

$$\Delta = \sum_{i,j} p_i p_j d_{ij} \quad (i \neq j)$$

- Variety times disparity: “**ecological entropy**” or “**quadratic entropy**”;
- Balance can be added (for example, Gini or Shannon entropy; between 0 and 1)
- **d** is a **distance measure**:
 - Euclidean distances
 - (1 – Jaccard); (1 – cosine)
 - The cosine is defined in the vector space.
- **True Diversity**: $^2D^3 = 1/(1 - \Delta)$ varies from 1 to infinity when Δ varies from zero to one.

<http://www.leydesdorff.net/software/diversity/net2rao.exe>

Between-group and within-group Diversity

Cassi, L., Mescheba, W., & De Turckheim, E. (2014). How to evaluate the degree of interdisciplinarity of an institution? *Scientometrics*, 101(3), 1871-1895. Further elaboration in Cassi *et al.*, 2017; cf. Chiu & Chao, 2014.

- In our opinion, Rao-Stirling diversity is a summation (Σ) like Shannon entropy and therefore **fully decomposable**.
 - Differences among aggregated subsets (“within group”) can be tested for significance using ANOVA with Bonferroni correction;
 - Off-diagonal parts of the matrix can be summed as between-group diversity.
- The matrix of diversity scores can be used for further analysis
 - Knowledge integration networks and knowledge diffusion networks.
 - Perhaps: “knowledge differentiation”?
 - See also <http://www.leydesdorff.net/software/diversity/net2rao.exe>

Decomposition of Diversity

$$\Delta \neq \Delta_0 + \sum_1^G P_G \Delta_G$$

Table 10: Decomposition of the diversity in the LIS set.

Specialism	${}^2D^3$ cited	Δ cited	${}^2D^3$ citing	Δ citing	N of journals
1. library science	54.02	12.36	59.11	13.19	32
2. information systems	31.95	7.14	22.51	2.86	19
3. bibliometrics	19.37	3.69	26.95	6.08	14
4. information and organization	14.15	2.3	13.75	2.41	10
5. information management	9.66	1.19	8.84	1.39	7
Within-group	129.15	26.68	131.16	25.93	82
Total	175.35	39.06	179.36	37.21	86

Table 11: Between-group diversity in the LIS set.

	Δ cited	Δ citing
0. between-group	20.82	21.61
	53.3%	58.1%
1. library science	8.33	8.21
2. information systems	5.58	2.56
3. bibliometrics	2.51	3.49
4. information and organization	1.06	1.08
5. information management	0.77	0.25
Total	39.06	37.21

Conclusions

Betweenness

1. BC can be considered as an indicator of **multi-disciplinarity**;
2. Valued BC improves on binary BC because citation networks are valued.

Diversity

1. Diversity in the citing dimension (“**knowledge integration**”) indicates **trans- or non-disciplinarity**;
 2. Diversity in the cited dimension (“**knowledge differentiation**”; bibliographic coupling) trades off between structure (selection) and action (variation);
 - this is probably the best indicator of “**interdisciplinarity**”;
- Diversity can be decomposed into within- and between-group diversity
see <http://www.leydesdorff.net/software/diversity>
